Instrument List:

- [Green](#)

Discussion:

Earlier in the day, very little activity occurred near the radar. Significant convective activity remained outside of the radar domain with a convective system moving in from the west producing plenty of 2nd trip echoes. As the evening wore on, the convective system moved eastward and resided in the northern part of the NPOL domain for a long time. Got plenty of good convective and stratiform data in the Turkey Creek sector. The system finally moved to the north around 12Z. Tornado safety plans have been put in place and a storm shelter in a house near the radar has been located. Also ran a test on the generator for loss in commercial power in anticipation of this weekend's severe weather. **Everything works fine and the generator has been set to auto.**
